EX 10	Firebase Integration

Aim

To build an app that integrates Firebase.

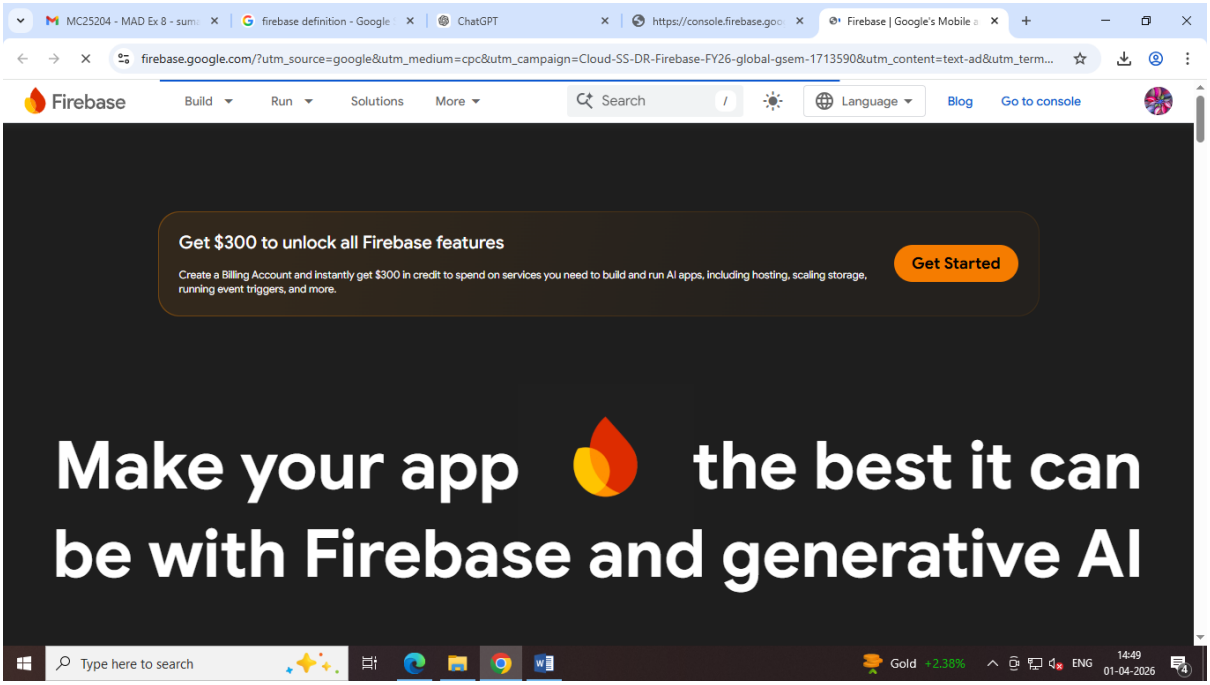
Definitions

Firebase

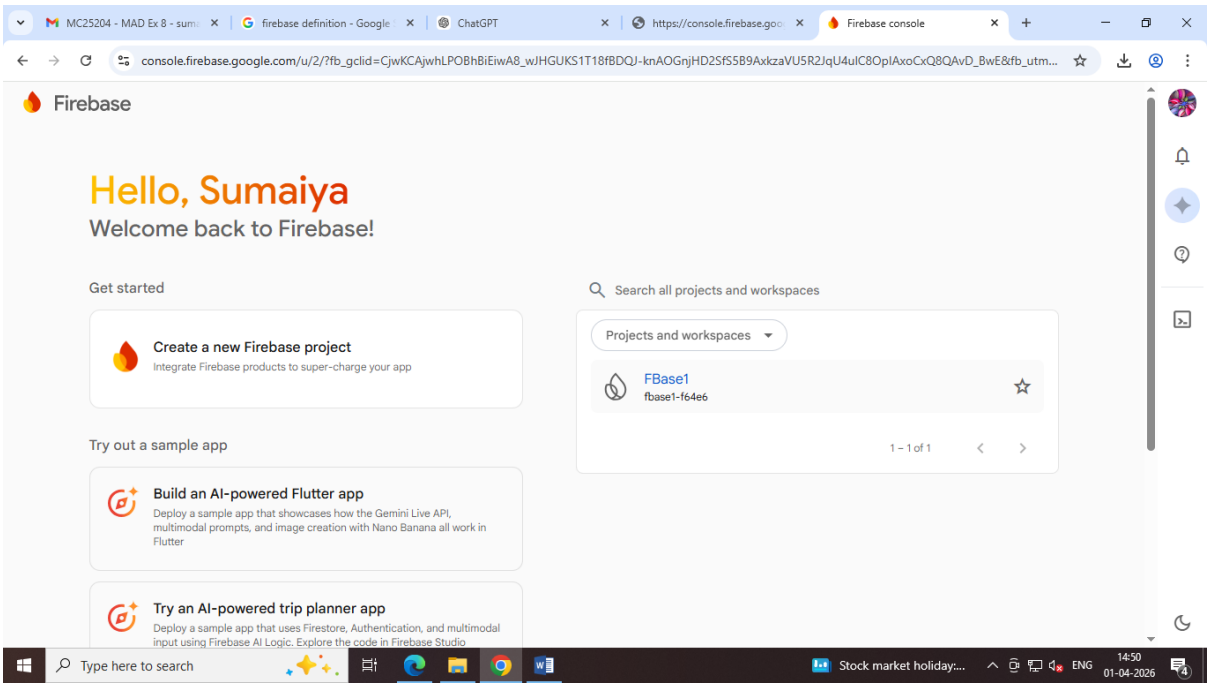
Firebase is a comprehensive app development platform by Google that acts as a Backend-as-a-Service (BaaS). It provides developers with pre-built backend services—such as real-time databases, authentication, hosting, and cloud functions—enabling them to build high-quality mobile and web apps without managing servers.

Procedure

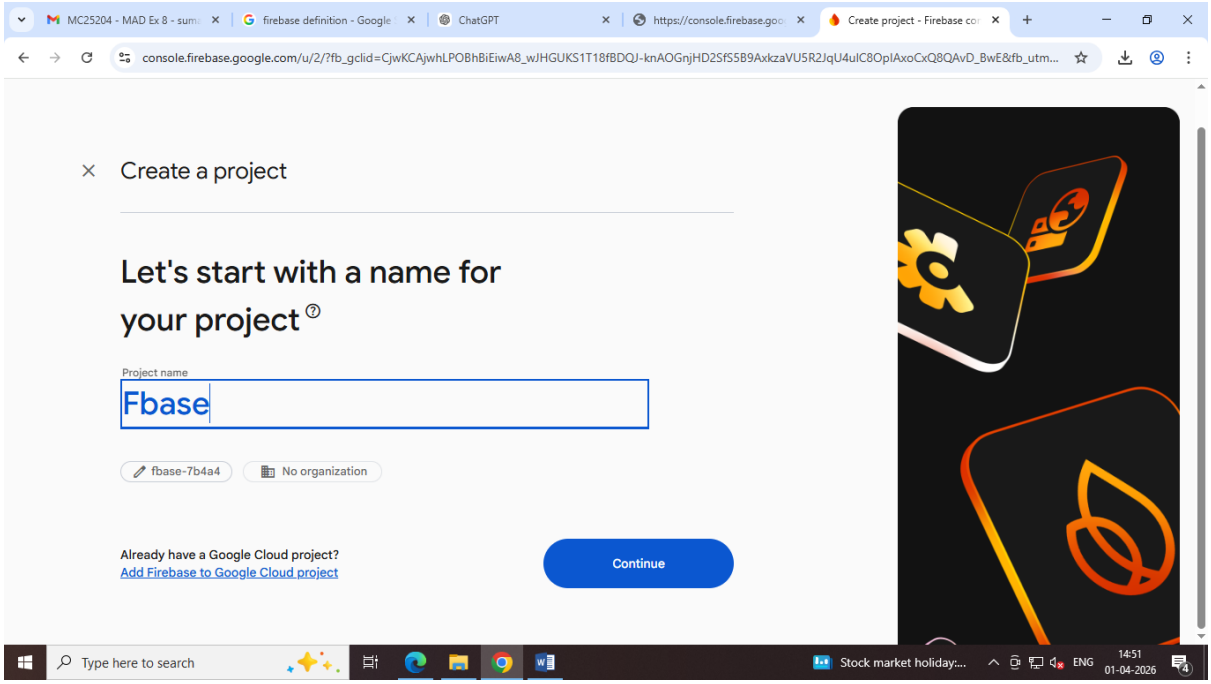
1. Open https://console.firebase.google.com/



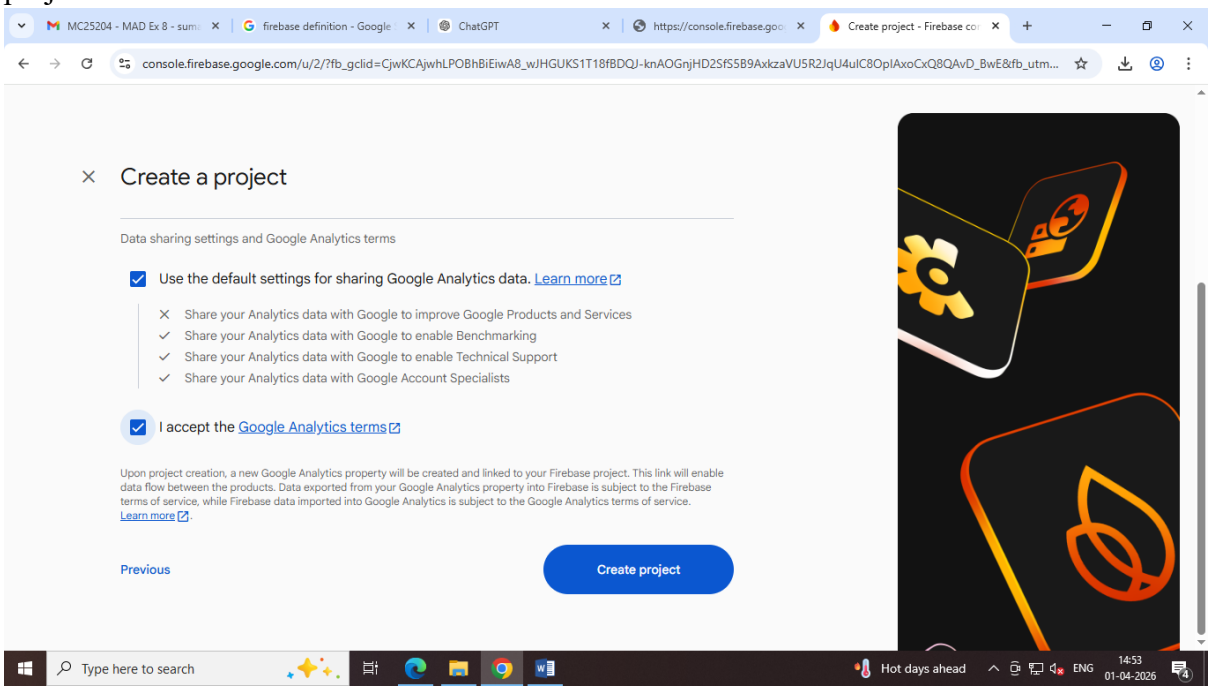
2. Click "Go to Console"



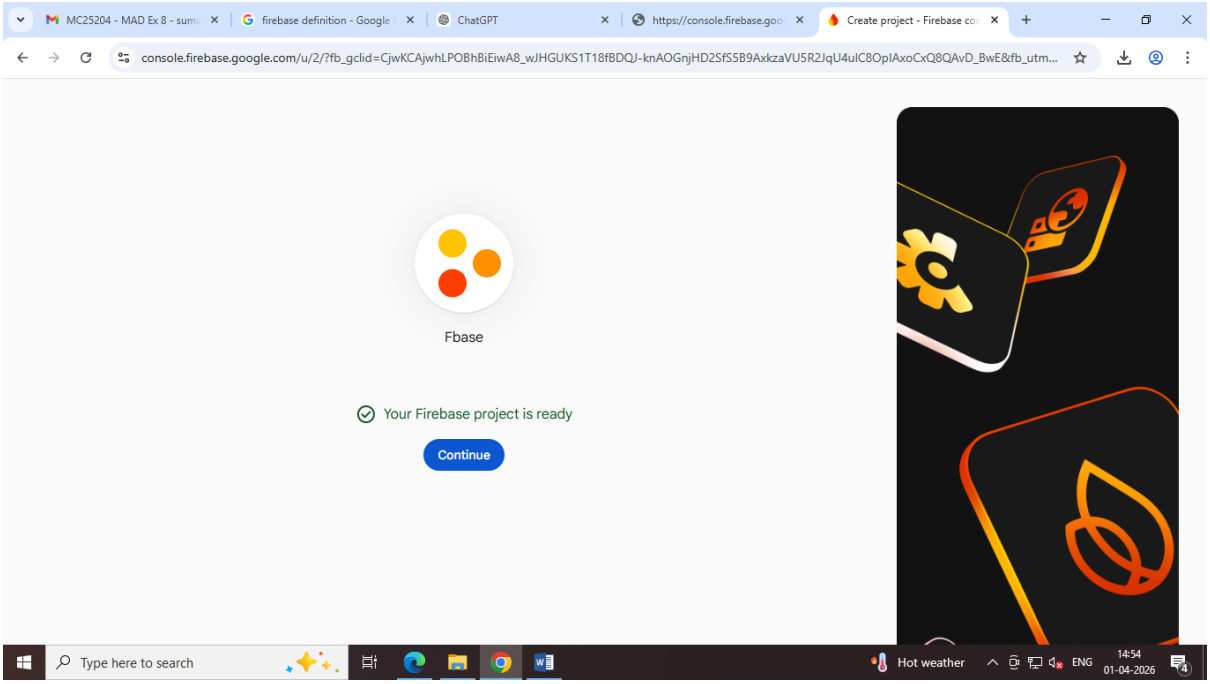
3. Click “Create a new Firebase project”, Specify the Project name and Click “Continue”



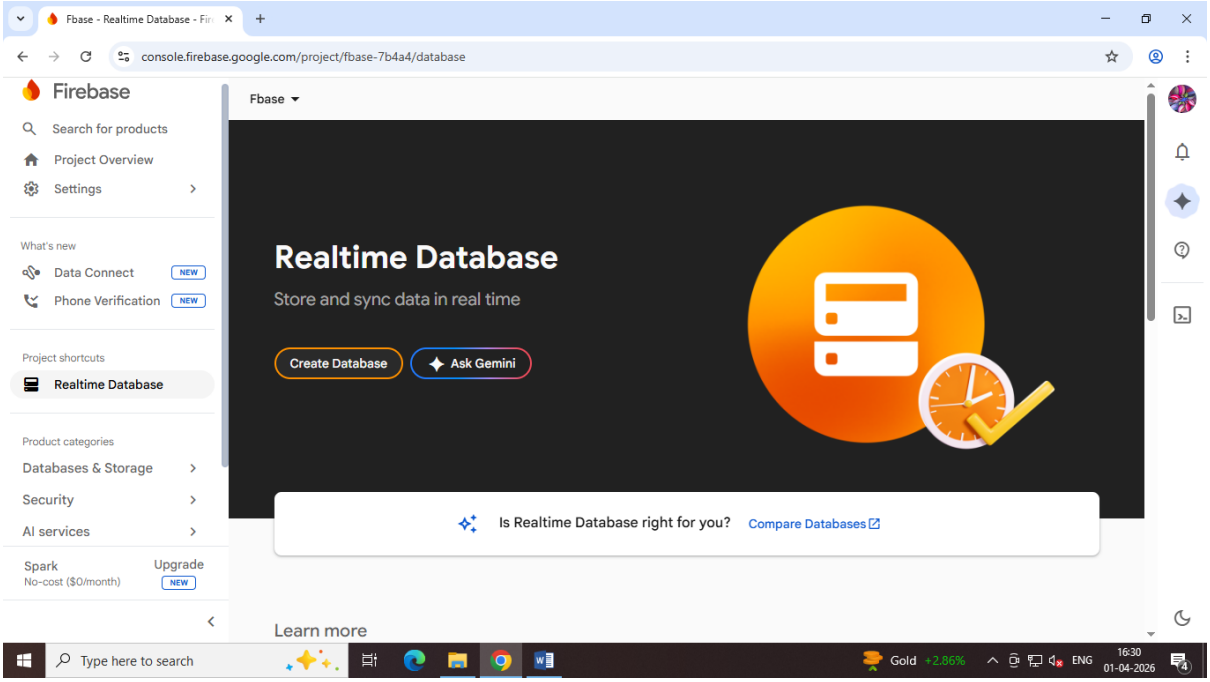
4. Then click “continue” in two subsequent pages, check “I accept” then click “create project”



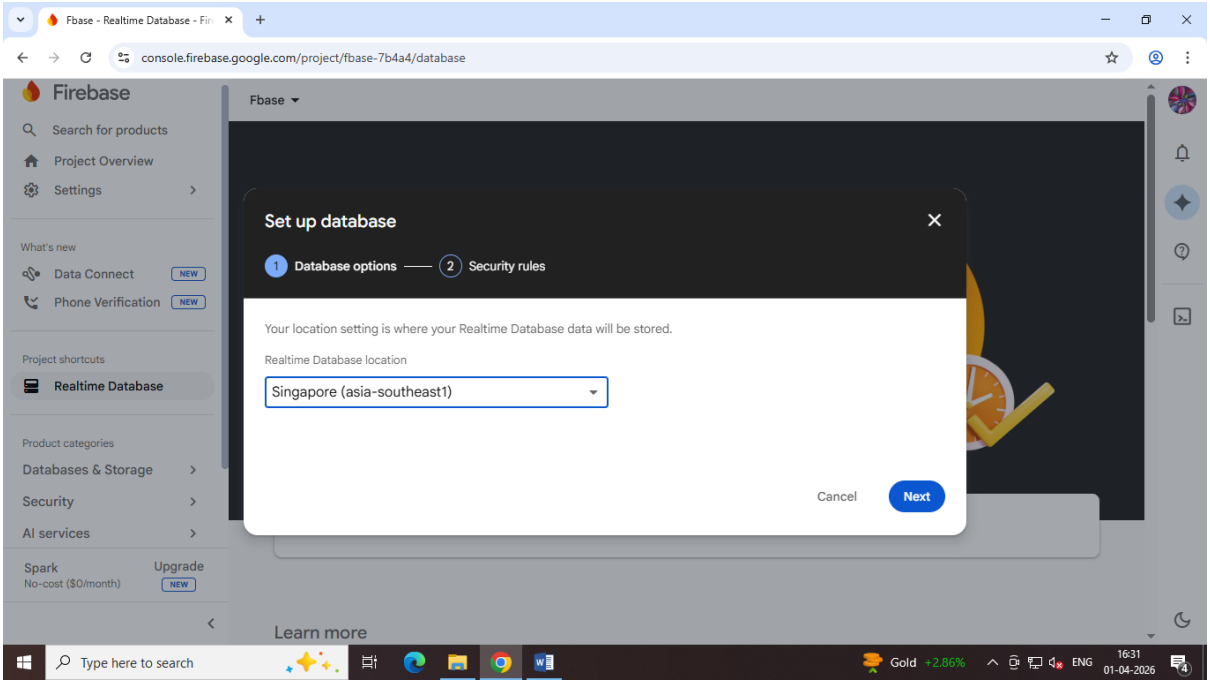
5. Press continue if your project is ready



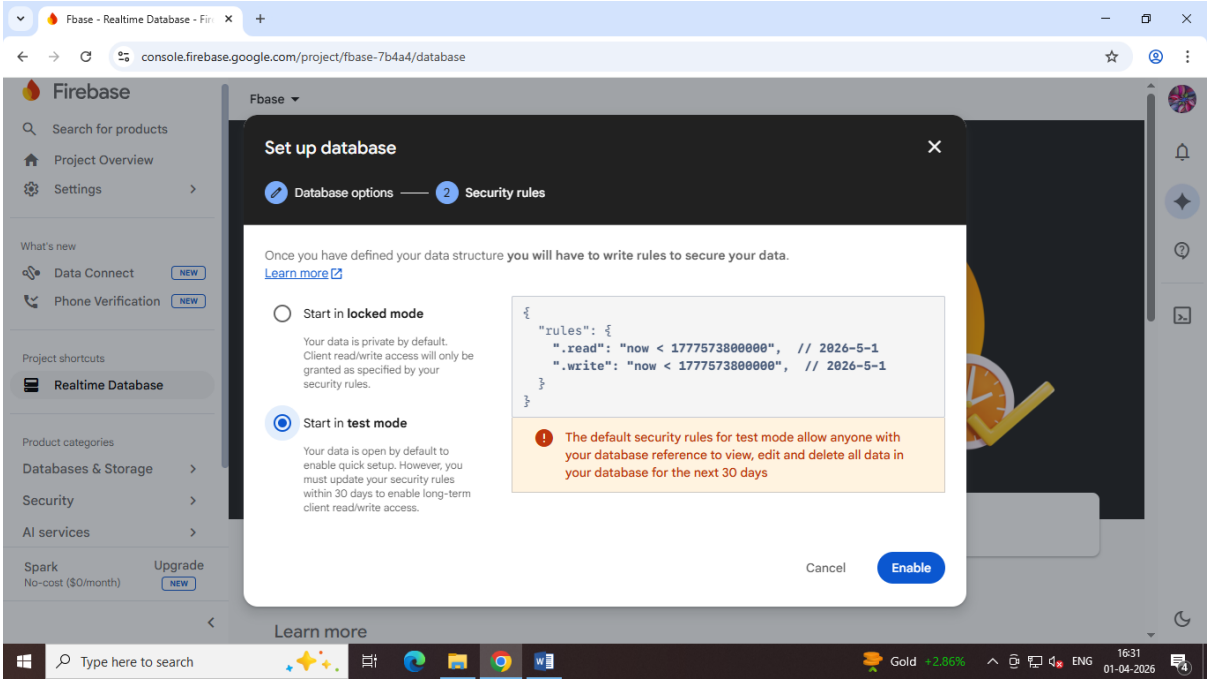
6. Go to databases and storage → select Realtime databases →click create database



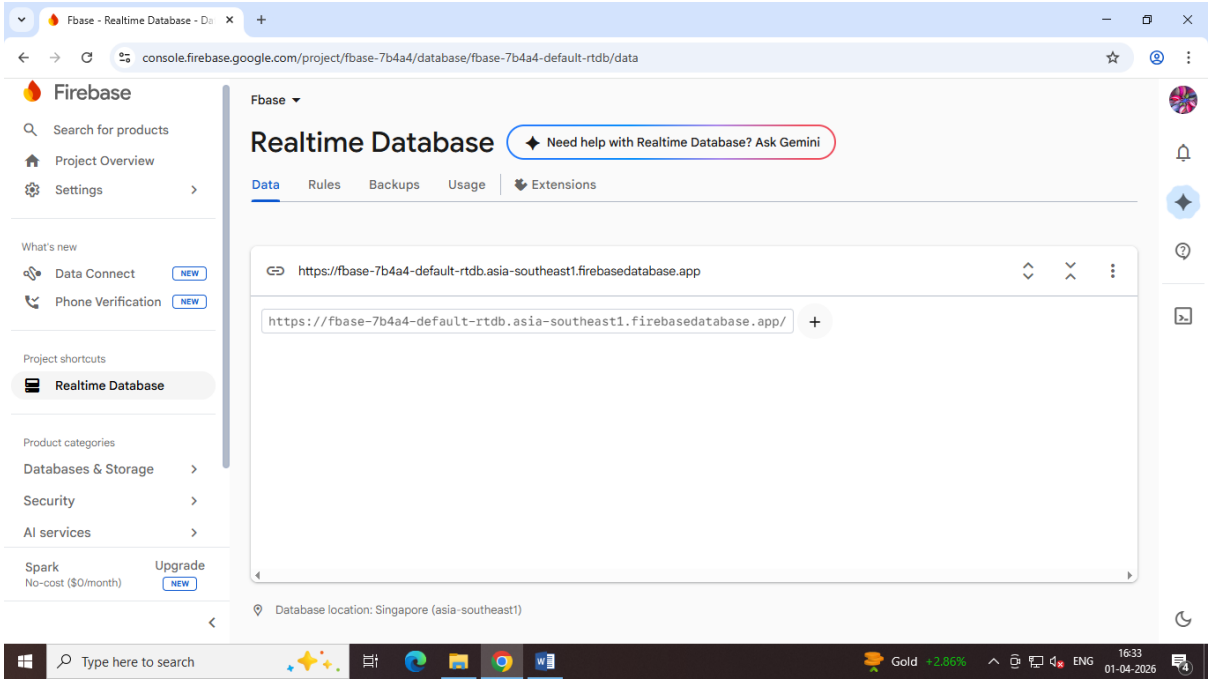
7. Select Singapore(asia-southeast1) → next



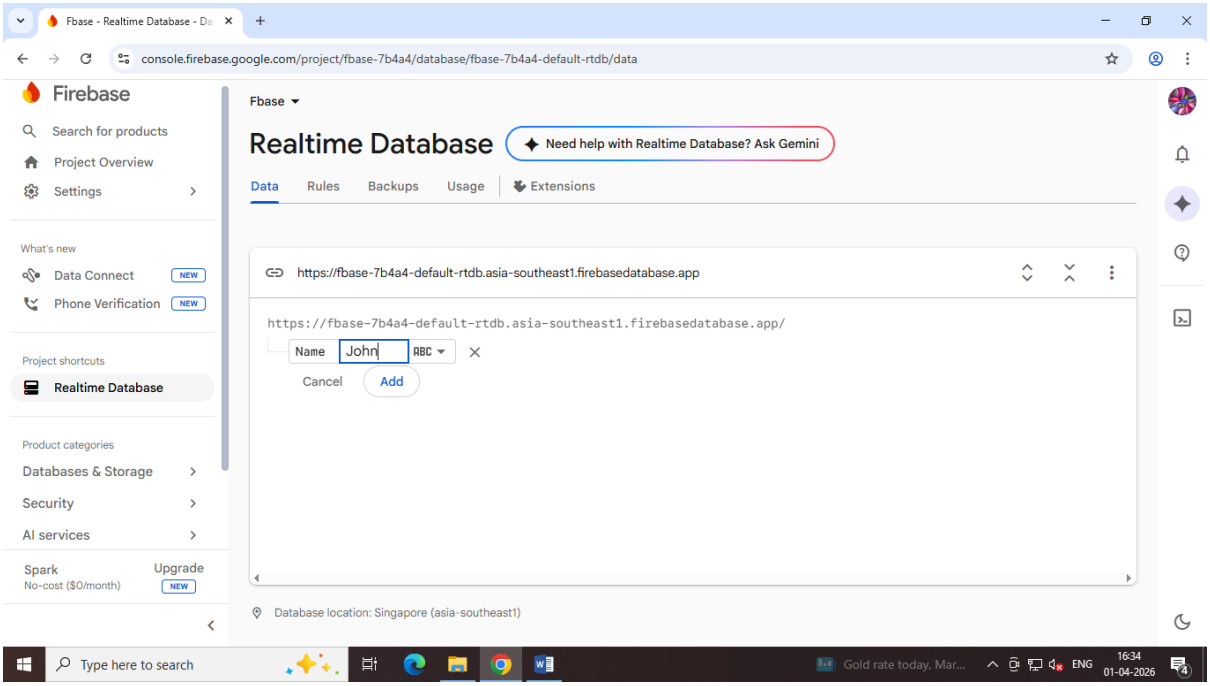
8. Select start in test mode → enable

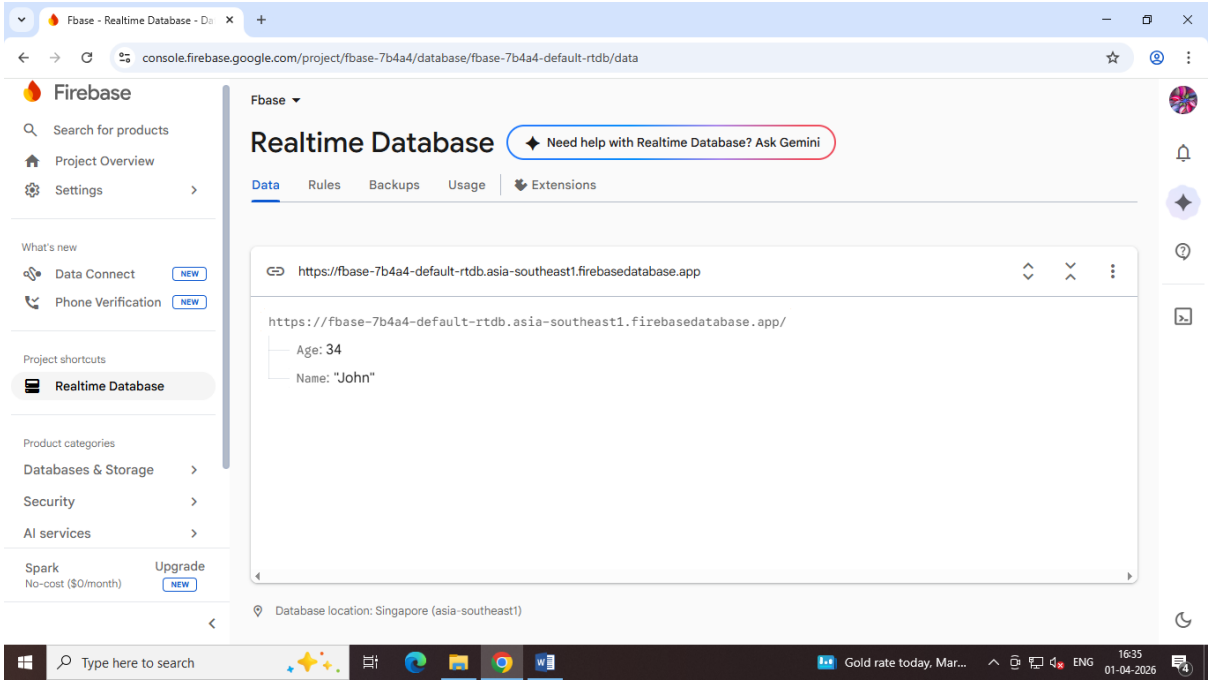


9. Click + symbol next to the url to add data

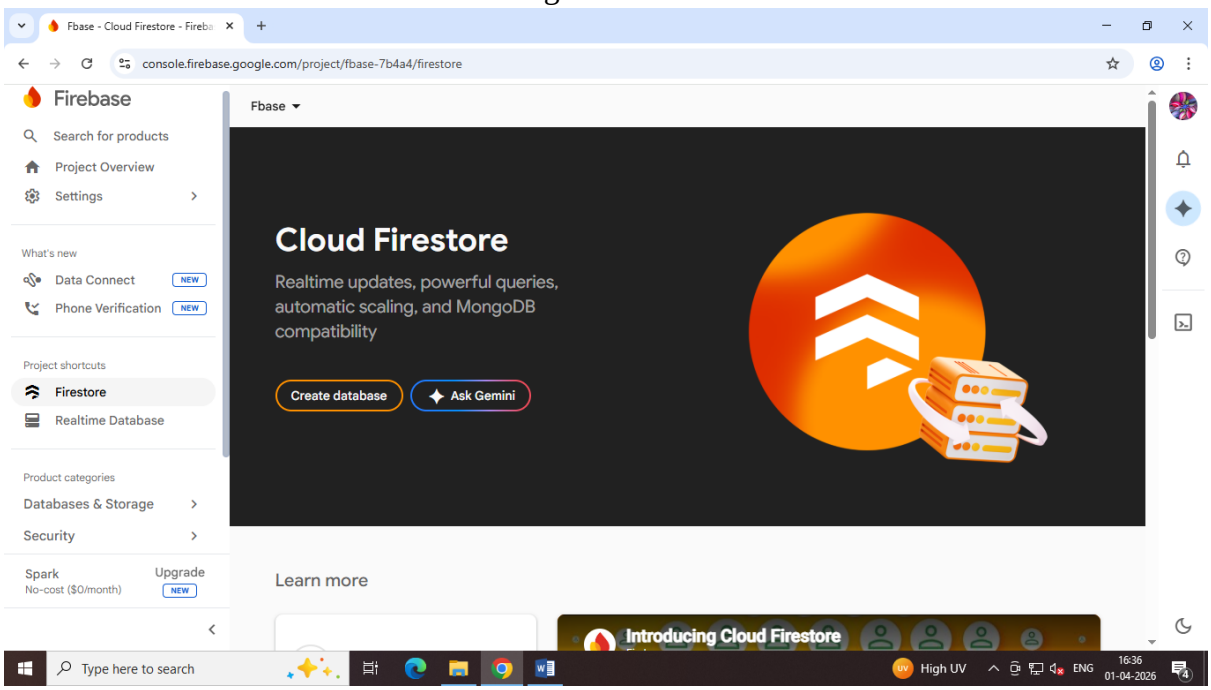


10. Enter data → click add button

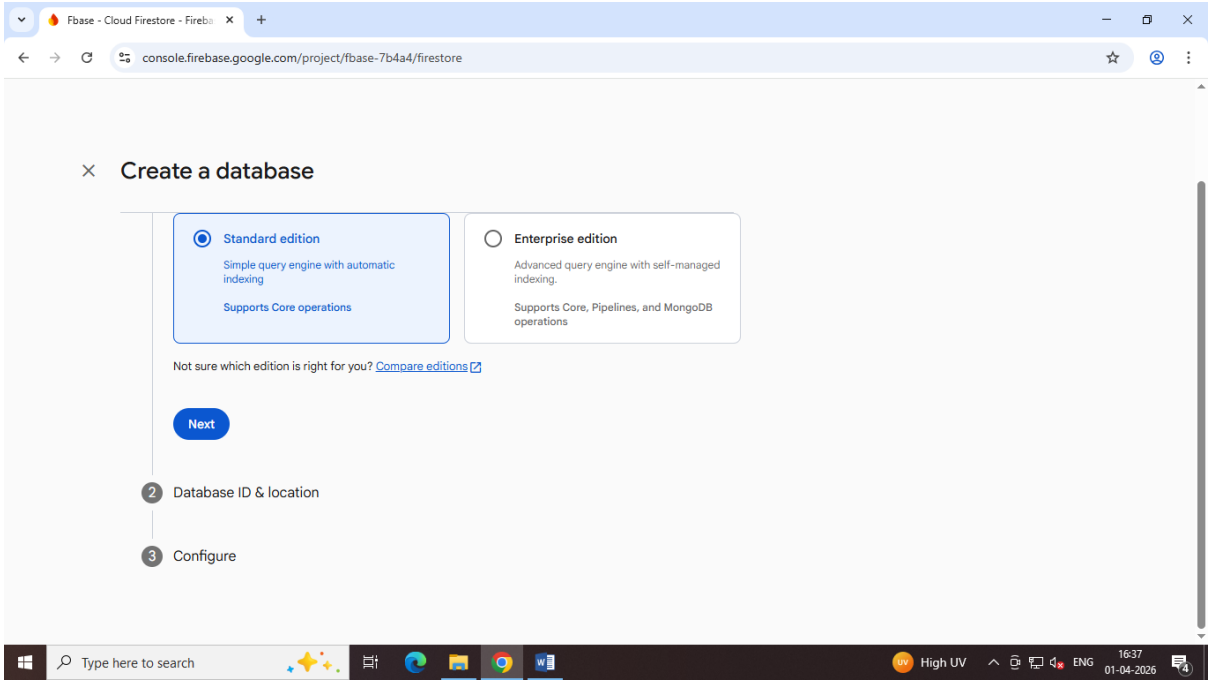




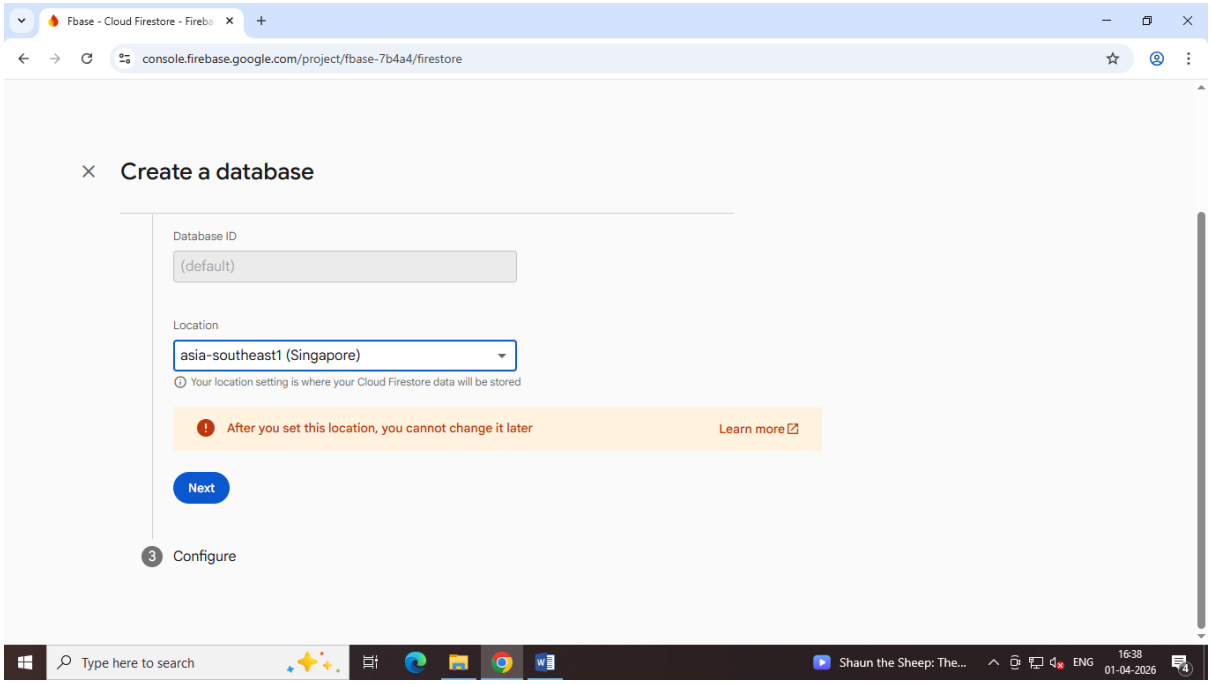
11. Choose FireStore from Databases & Storage.



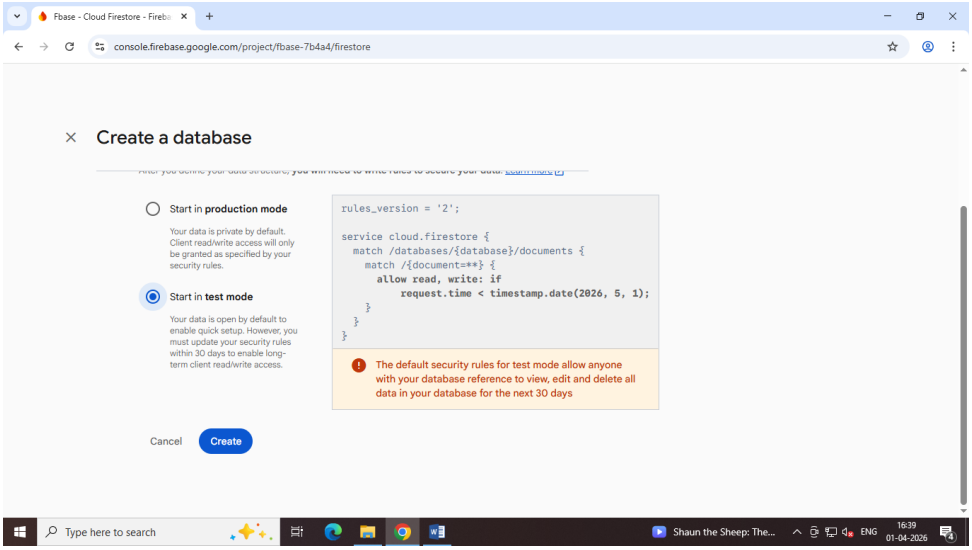
12. Click create database → choose standard edition → next



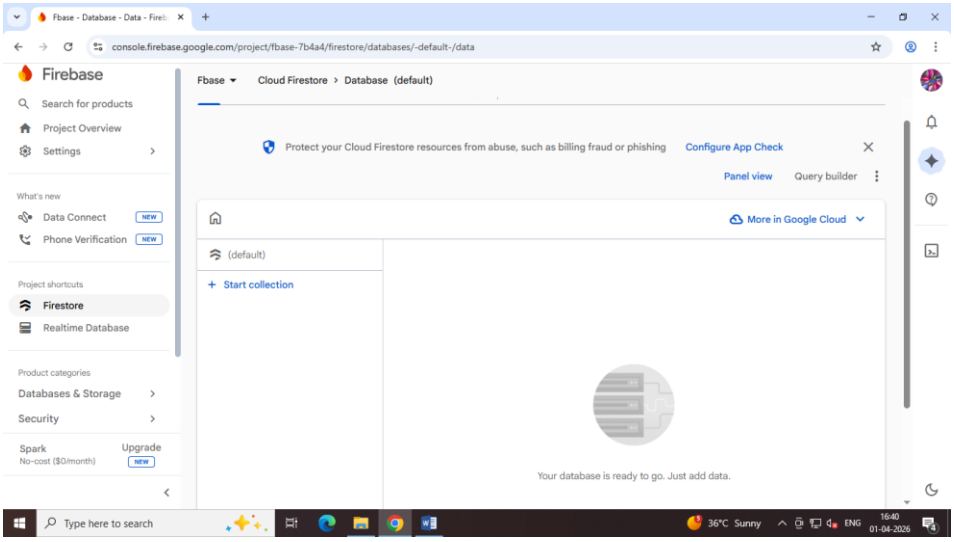
13. Choose the location as "asia-southeast1 (Singapore)" → next



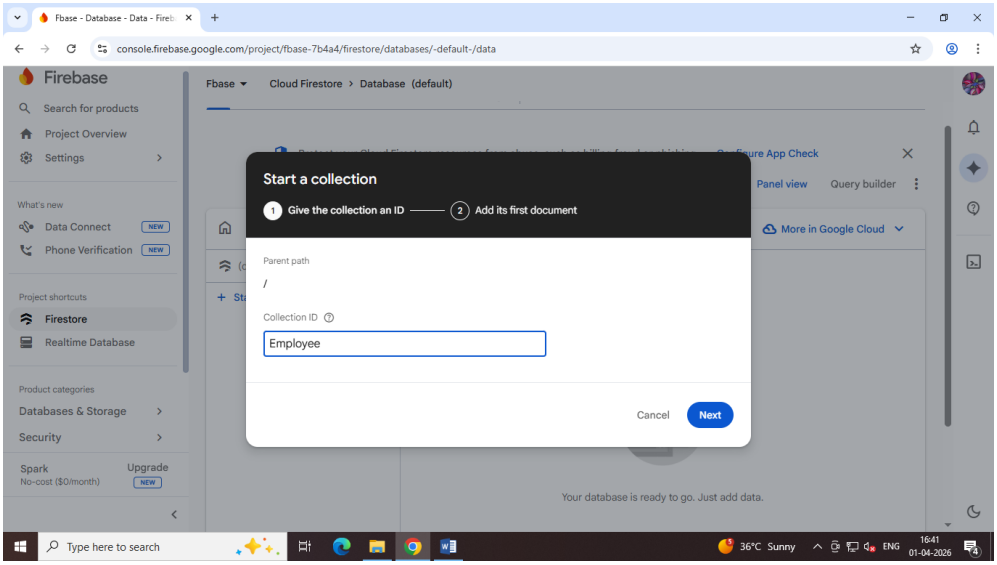
14. Select “start in test mode” →create



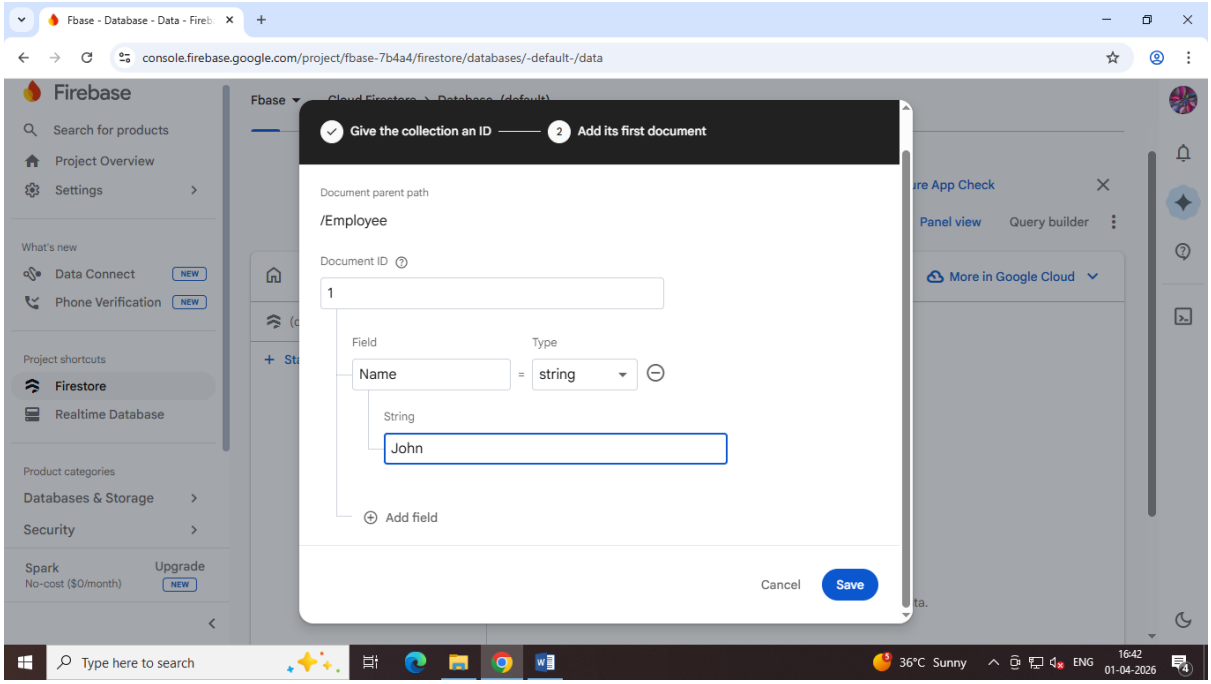
15. Click + start collection to create a collection

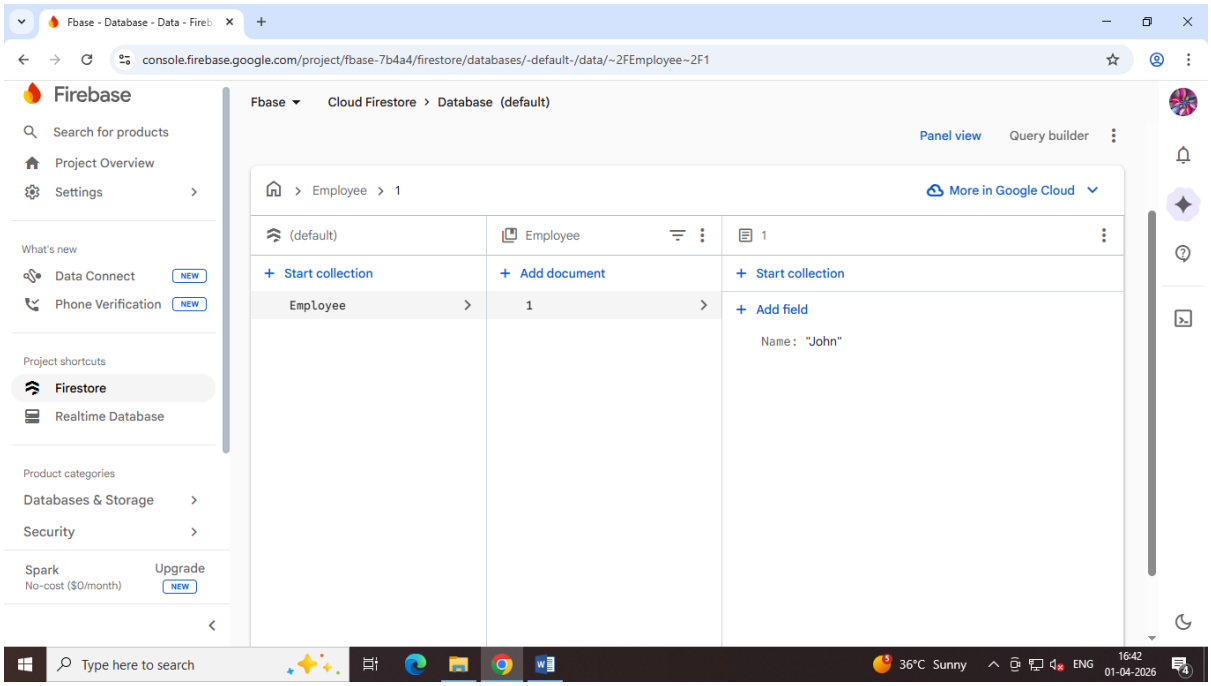


16. Specify the collection name → next

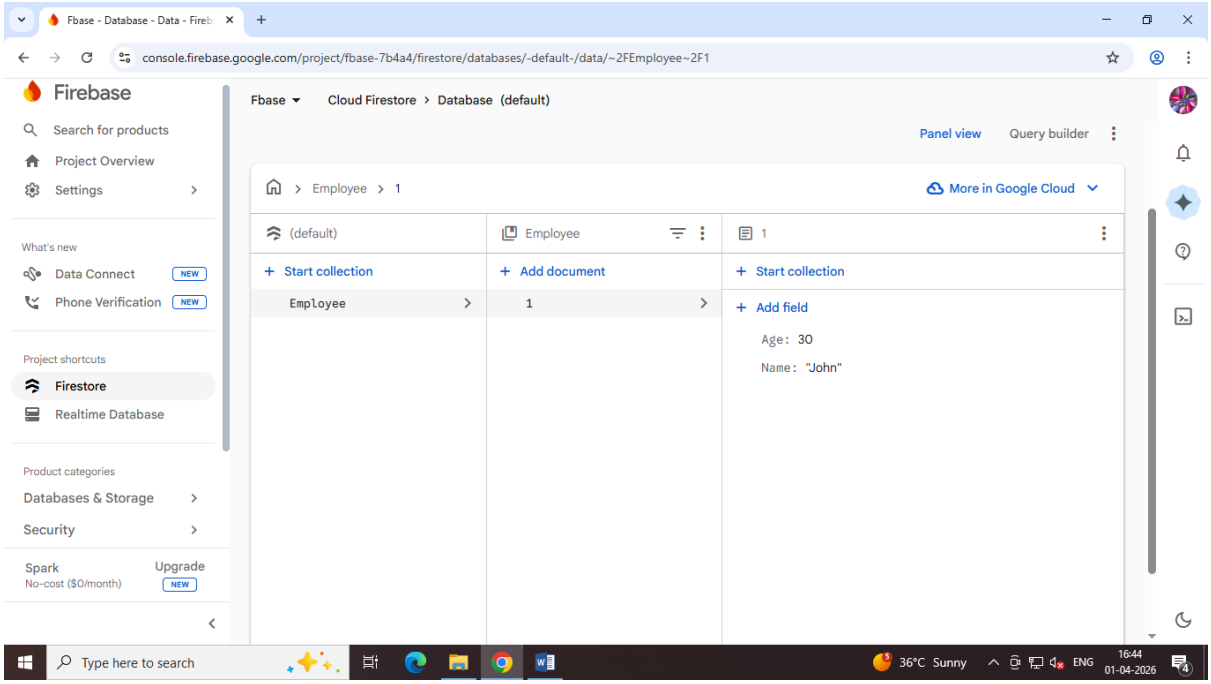


17. Mention the document id, field name and value the click save to save the data





18. Click +start collection, +add document and +add field to add as many as data



19. Follow the steps to integrate android app with Firebase:
    - Go to: https://console.firebase.google.com/
    - Click **Add Project**
    - Enter project name
    - Continue (you can disable Google Analytics if not needed)
    - Click **Create Project**
    - Inside your project, click **Add App → Android**
    - Enter:
    - **Package name** (must match your app exactly)
    - App nickname (optional)
    - SHA-1 (optional but required for some features like Google Sign-In)
    - Click **Register App**
    - Download **google-services.json**
    - Place it inside your app folder: **app/google-services.json**

Result

Thus, an app that integrates Firebase has been built.
